

Hello,

I wish to make a comment for the quiet user. After reviewing your draft it is quite obvious that you spent most of your efforts making sure there are trails for the motorized user. Yet the motorized user damages the trails more easily, displaces the elk further from the trails they use, and they never stay on the trails causing even more damage! The motorized user never has enough, and they threaten the Forest Service with lawsuits if they do not get their way! But if the Forest Service would rely on scientific data, and protect the fragile environment they would not have to worry. The biggest problem with this draft is there is not any data to support anything! I think it is back to the drawing board.....

Sincerely,

Craig Walsh
