Last name: McNamara

Organization: Global Earth Repair Foundation

Title:

Comments:

As the ecosystem continues to deteriorate globally, we need whatever standing woods remain to stay pristine. These are the sponges of our planet and we need them intact. This is a "road" into resource exploitation where public eyes can't see. As ecosystem regeneration is the best solution we can see so far to reverse the forces of global desertification and climate catastrophe, it's critical to preserve these forests. This puts populations of wildlife and indigenous people at risk as well - the wild parts of this planet are precious. USDA should think about regenerating the land in our use instead of turning to prospecting the wild regions and the public commons. Thank you.
