Comments:

Reasons against the foothills project:

Too Large: Past experience already shows that the forest service has failed to implement Replanting Projects. Lack of funding, manpower, research options will lead to Further failure on a larger scale and cause irreplaceable HARM to PUBLIC lands.

Too much logging: Even "temporary" logging roads permanently destroy fragile soils washing The fertility of the mountains into drainage ditches forever. Exposed surfaces dry Out, water tables drop, reliable drinking water disappears, global warming and Climate change rises.

Tourism dollars lost: Thousands of dollars support local businesses. Tourists don't want to pay for Zig zagging logging roads, bare naked patches, silted up streams and swathes of Poisoned vegetation.

Worst Science has to offer: EPA safety standards for herbicide spraying are based on outdated Studies nearly 10 yrs old paid for by Monsanto which is currently being sued for Millions of dollars in federal courts as "probable cause of cancer" and punitive Damages for failure to notify the public how to safely spray their POISON. An avalanche of future cancer victims being awarded million dollar settlements Caused Monsanto to sell out to Bayer who can afford a few million while making Billions selling Roundup to complacent consumers and Billions more on drugs When they get sick.

Site Specific Lacking: To save money on paying for costly scientific EIS the conclusion was Made in the EA that the whole project was a GO before knowing exactly where It was going. The public has a "right to know" site specific information BEFORE Implementing any plan on managing PUBLIC LANDS.
