Please, no toxic herbicides in our forests. Independent study after study has proven that these substances are harmful. They are harmful to humans as well as the animals living in these places. I had rather walk through a pristine forest full of invasives, than a toxic forest managed with herbicides. There must be a better way. How will you keep these chemicals out of our streams and rivers? I volunteered for nearly a year checking water samples in one of our North Georgia towns. Our streams and rivers already suffer from industry and human activity. I tracked threatened turtles to see the impact of invasives on native species. Let's leave our wild places alone. As someone who studied and majored in environmental issues, it just blows my mind that chemicals are a management option for our wild places.
